

# Properties of Oilfield Waters

Lectures # 30 – 31

PETE 310

# Topics

- Brine composition and density
- Water (brine) compressibility
- Formation volume factor and  $P_b$
- Viscosity
- Mutual solubilities (gas in water, water in gas)

# Water Production Issues

- Oil and gas wells produce more water than oil (7 bbl/1 bbl oil in Texas)
- Composition of co-produced water determines need for anti-scaling additives
- Regulations limit disposal and beneficial use options
- Environmental impact

# Oilfield Water Issues

- Expensive Oilfield Water Management
- Diversity of Oilfield Waters (amount, compositions)
- Corrosion, Scale Control and Plugging
- Microbiological Problems
- Water Quality for Water-flooding, Steam Injection or Surface Disposal
- Injectivity Decline in Water Injection Wells

# Dissolved Solids in Brines

## ■ Cations

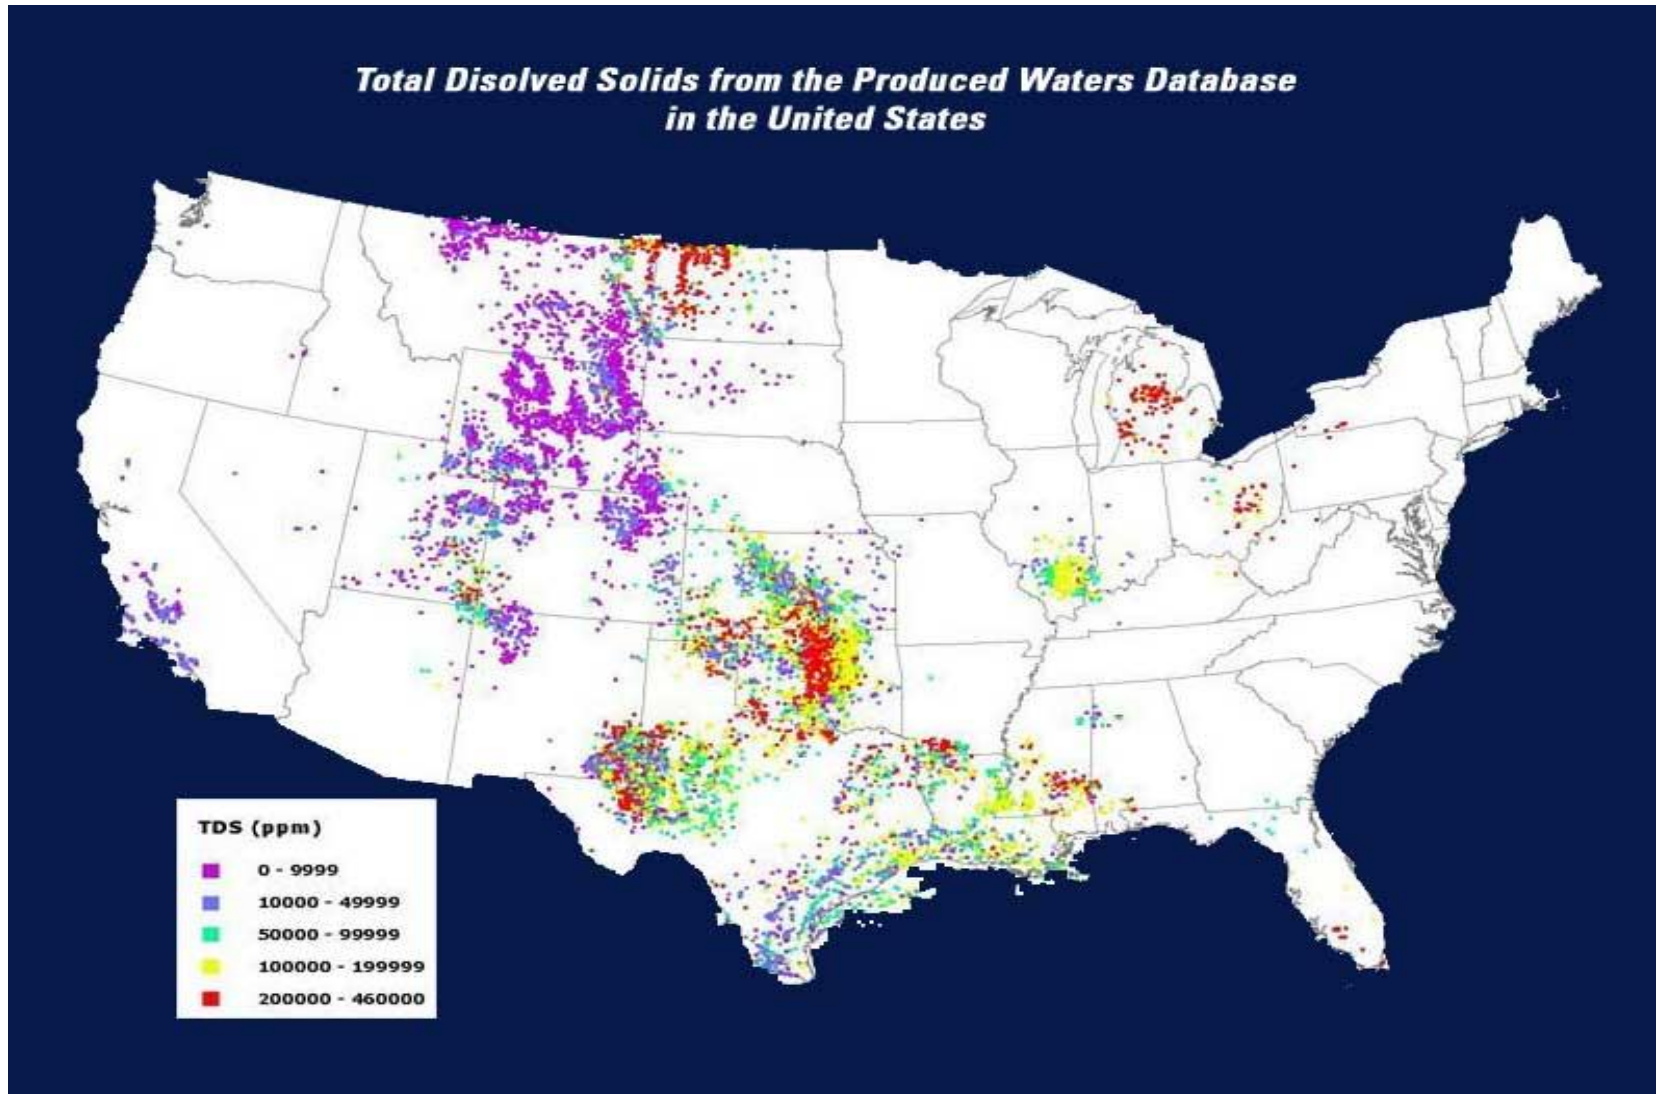

- Na<sup>+</sup>
- K<sup>+</sup>
- Li<sup>+</sup>
- Ca<sup>++</sup>
- Mg<sup>++</sup>
- Ba<sup>++</sup>
- Fe<sup>++</sup>
- Sr<sup>++</sup>

## ■ Anions

- Cl<sup>-</sup>
- SO<sub>4</sub><sup>=</sup>
- CO<sub>3</sub><sup>=</sup>
- CO<sub>3</sub>H<sup>-</sup>
- NO<sub>3</sub><sup>-</sup>
- Br<sup>-</sup>
- I<sup>-</sup>

# Total Dissolved Solids (TDS)

# Measures of Solids Concentration

TABLE 16-1

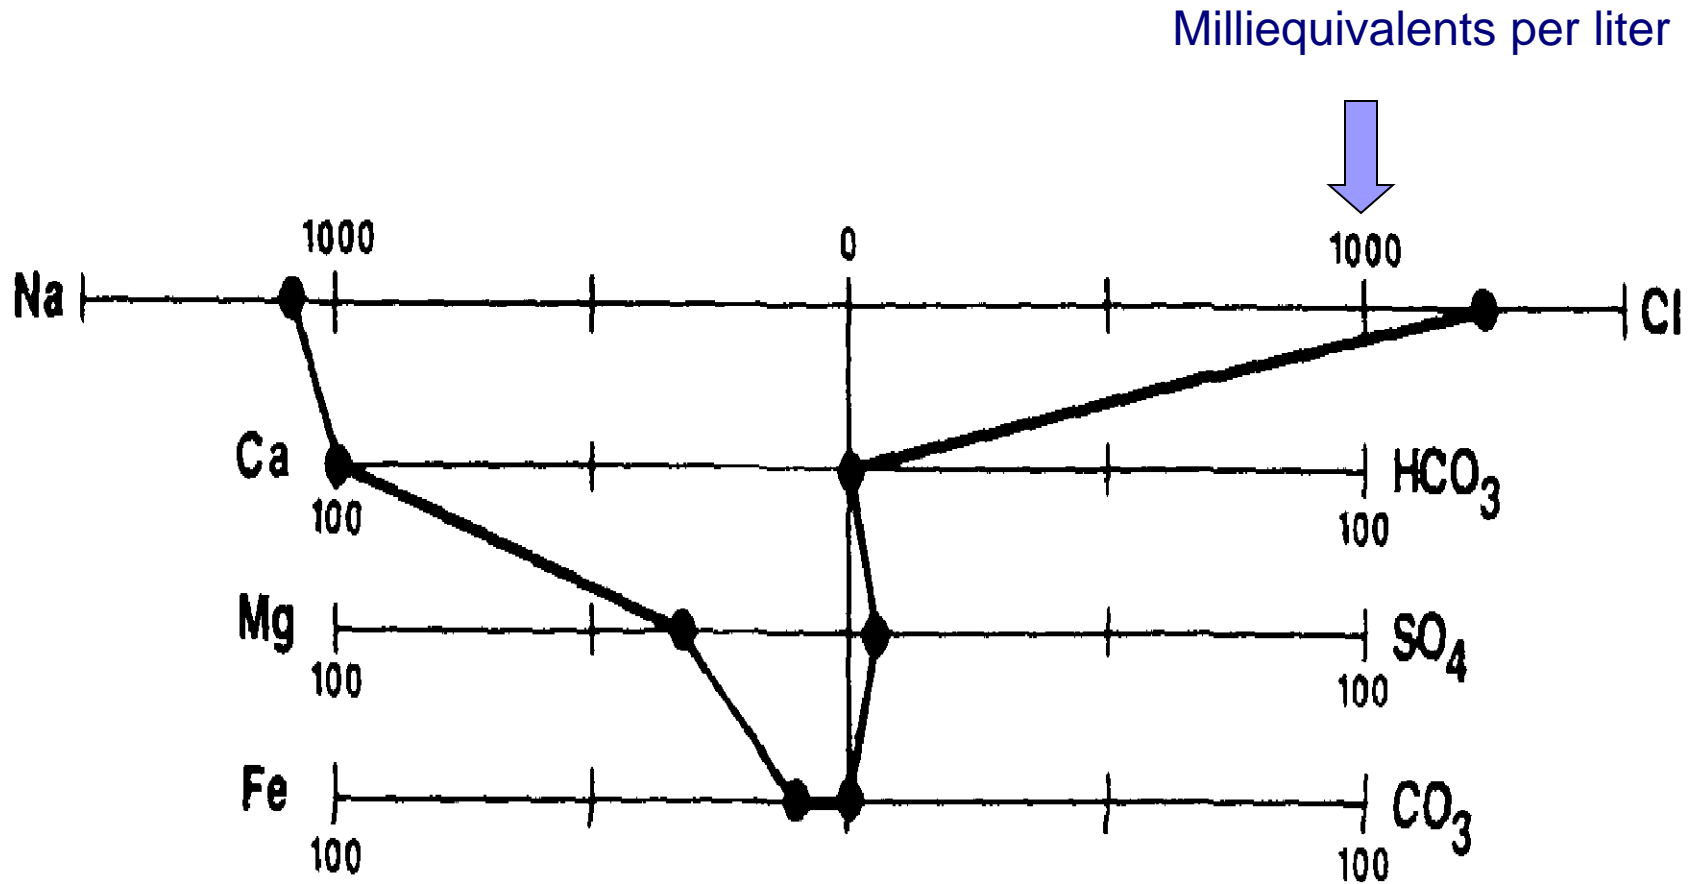

Summary of nomenclature and units for concentration of dissolved solids in formation waters (adapted from Monograph Series, SPE 9, 38)

Term	Symbol	Definition	Equations
Molality	$C_m$	$\frac{\text{g mole solid}}{1000 \text{ g pure water}}$	
Molarity	$C_M$	$\frac{\text{g mole solid}}{1000 \text{ ml brine}}$	
Normality	$C_N$	$\frac{\text{eq wt solid}}{1000 \text{ ml brine}}$	
Milliequivalents per liter	$C_{\text{meq/l}}$	$\frac{\text{meq solid}}{1000 \text{ ml brine}}$	$C_{\text{meq/l}} = 1000 \times C_N = C_{\text{mg/eq wt}}$
Weight percent solids	$C_W$	$\frac{\text{g solid}}{100 \text{ g brine}}$	$C_W = C_{\text{ppm}} \times 10^{-4}$
Parts per million	$C_{\text{ppm}}$	$\frac{\text{g solid}}{10^6 \text{ g brine}}$	$C_{\text{ppm}} = C_W \times 10^4 = C_{\text{mg/l}}/\rho_w$
Milligrams per liter	$C_{\text{mg/l}}$	$\frac{\text{g sold}}{10^6 \text{ ml brine}}$	$C_{\text{mg/l}} = \rho_w \times C_{\text{ppm}} = \rho_w \times C_W \times 10^4$
Grains per gallon	$C_{\text{gr/gal}}$	$\frac{\text{grains solid}}{\text{gal brine}}$	$C_{\text{gr/gal}} = 17.1 \times C_{\text{mg/l}} = 17.1 \times \rho_w \times C_{\text{ppm}}$

where  $\rho_w$  is in g/cc at standard conditions

$\rho_w$  is  
brine density  
which depends upon  
solids in solution

# Stiff Diagrams

# Typical Concentrations

<b>Cation</b>	<b>ion concentration, ppm</b>	<b>Anion</b>	<b>ion concentration, ppm</b>
Sodium	23,806	Chloride	41,312
Calcium	1,906	Bicarbonate	51.5
Magnesium	375	Sulfate	283
Iron	297	Carbonate	0
Barium	0		

TDS = 68,030 ppm  $\rightarrow$  6.8%  $\rightarrow$  get  $\rho_w$   $\rightarrow$  convert to mg/l

<b>Cation</b>	<b>ion concentration, mg/l</b>	<b>Anion</b>	<b>ion concentration, mg/l</b>
Sodium	24,939	Chloride	43,278
Calcium	1,997	Bicarbonate	54
Magnesium	393	Sulfate	296
Iron	311	Carbonate	0
Barium	0		

Conversions: mg per liter →  
milliequivalents per liter

- See examples in text

# Conversions: mg per liter → milliequivalents per liter

- Valence is # of charges (+ or -). Expressed as equivalent wt per g mole
  - $\text{Ca}^{++}$  has ionic weight of 40.08 g/g mole
  - Equivalent weight is
    - $40.08 \text{ g/g mole} / 2 \text{ eq wt/g mole} = 20.4 \text{ g/eq wt}$
- Atomic weight divided equivalent weight is mg / meq
- Milliequivalents per liter of calcium are
  - $*** \text{ mg/l} / 20.04 \text{ mg/meq} = ***$

# Periodic Table

[Info for each element here!](http://pearl1.lanl.gov/periodic/default.htm)

H																			He
Li	Be											B	C	N	O	F		Ne	
Na	Mg											Al	Si	P	S	Cl		Ar	
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br		Kr	
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I		Xe	
Cs	Ba		Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At		Rn	
Fr	Ra		Rf	Db	Sg	Bh	Hs	Mt	Uun	Uuu	Uub								
			La	Ce	Pr	Nd	Pm	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb		Lu	
			Ac	Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No		Lr

# Bubble Point Pressure of Oilfield Water

- $P_b$  is the same as the  $P_b$  of the coexisting oil due to thermodynamic equilibrium

# Formation Volume Factor ( $B_w$ )

- Depends upon pressure

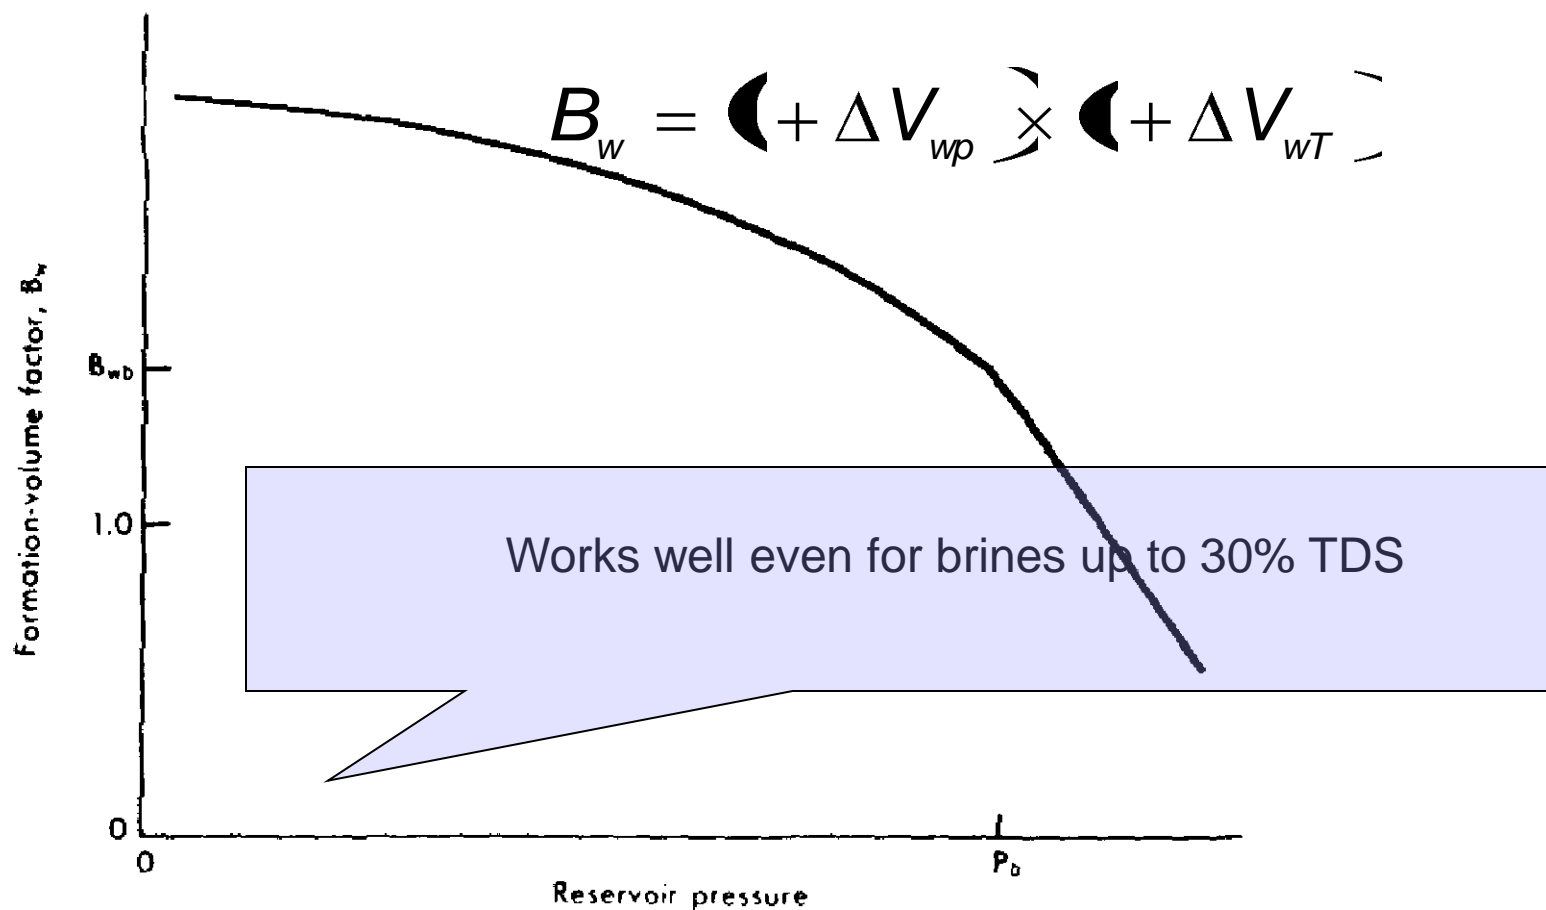

Offsetting

- Depends upon temperature

- Depends upon gas in solution

- negligible effect -

# Formation Volume Factor of Water ( $B_w$ )

$$B_w = \left( + \Delta V_{wp} \right) \times \left( + \Delta V_{wT} \right)$$

# Temperature Correction

# Pressure Correction

# Effect of TDS on Brine Density

# Solubility of Hydrocarbons in Water

# Solubility of Methane in Water

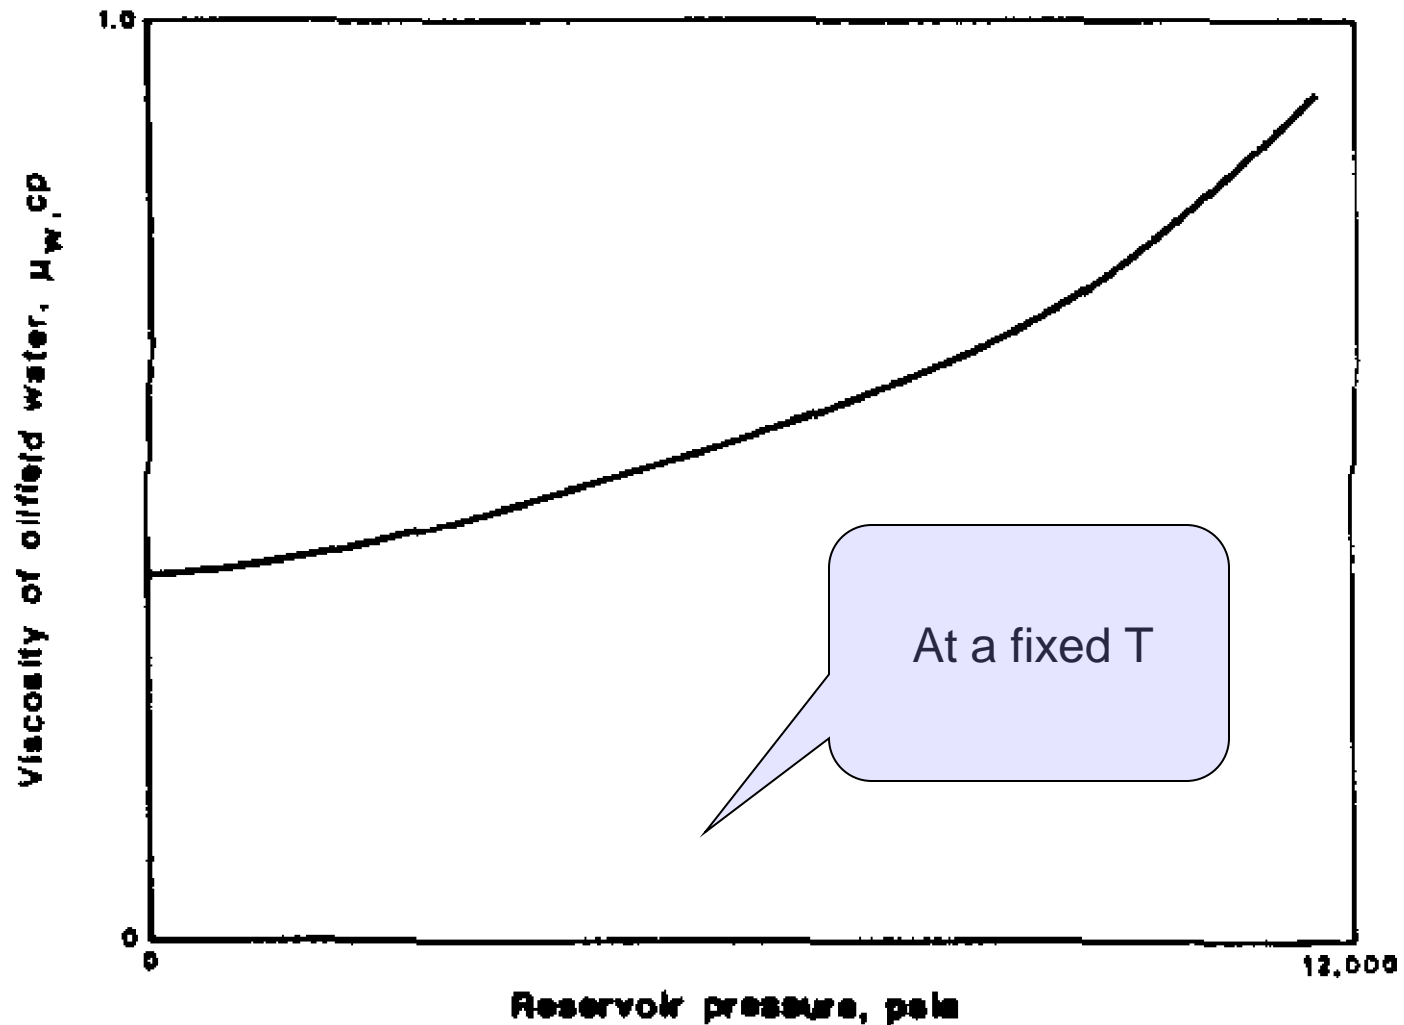

# Effect of Salinity on solubility of gas in water

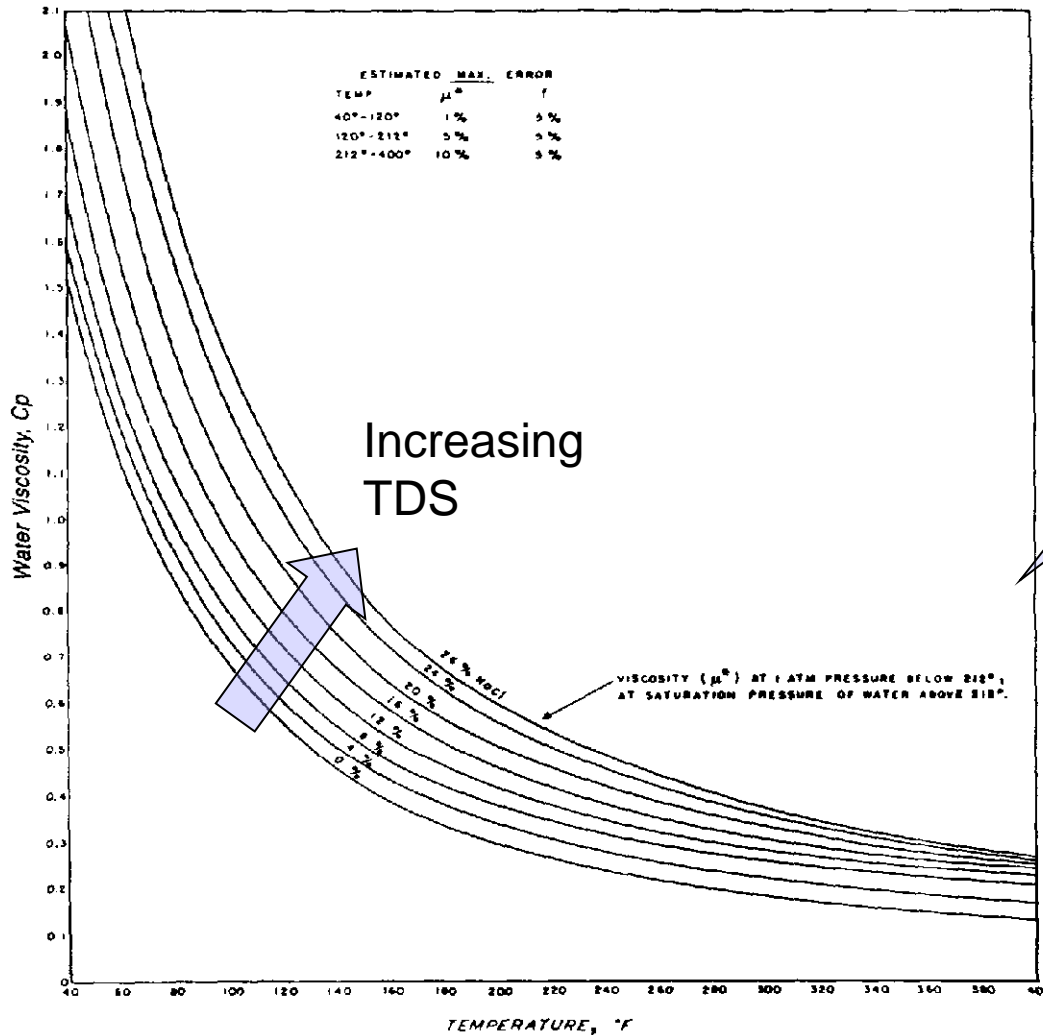

# Coefficient of Isothermal Compressibility ( $C_w$ )

# Viscosity of Water versus Pressure

# Water (Brine) Viscosity versus TDS

At atmospheric pressure

# Viscosity of Water at Reservoir Pressure

# Solubility of Water in Natural Gas (low pressure)

Lb of water / MMSCF

# Solubility of Water in Gas (high P)

Lb of water / MMSCF

To evaluate  
dehydration requirements  
(equipment, chemicals)  
In  
natural gas processing

# Resistivity of Oilfield Water

- Use in logging tools
- Formation evaluation
- Resistivity is inversely proportional to conductivity

$$R_w = rA/L = [\text{ohm/meters}]$$

# Calculate Resistivity or TDS

# Gas-Water IFT
